

## In-Class Project Feedback

Team: SlamStats Analytics

Members: Jacob Layton, Vincent Funtanilla, John Chae

### Feedback:

- Account for time in year that players play. In determining awards, it is often important that the award winners play well near the end of the year as it is closer to when the awards are handed out.
- Add team records for player data. Often when determining awards the teams record plays an important role in determining who will get the award.
- Account for media impact. A player who has a strong media presence/story is more likely to win an award
- Account for the number of awards a player has won. A player who has won an award multiple times is unlikely to be selected again.

We found our feedback to be very helpful. We will incorporate the team records and number of awards a player has won to our player data. We hope incorporating this data will increase the accuracy of our model. We will not account for the time of year or media impact as this data would be hard to obtain.
